

Cont.  
a<sup>2</sup>

the resin component. The resin component (B) generally contains the backbone of polyether or polyester, chain extender, catalyst and flow control agent. Pigment and/or dyes and dispersions thereof also are generally included in or added to component (B) prior to the reaction with the isocyanate (component (A)). The coloring agent must be compatible with the resin component (B) so that the color will be uniformly dispersed in component (B). If the pigment or dye is not compatible with component (B), then settling of the pigment and clogging of filters can result. U.S. Patent 4,721,531, incorporated herein by reference, discloses methods for incorporating pigment into such mixes along with ultraviolet light stabilizing compounds and heat stabilizers to provide uniform dispersion. As used herein, dyes are soluble in the mix, while pigments may or may not be soluble.

In the Claims:

Please rewrite claim 16 to read as follows:

- a<sup>3</sup> 16. The form of claim 1 which is resistant to denting at 110°F and has a flexural stress value of at least about 800 psi at deflection 5% of its thickness as measured by ASTM D 790-99.

Please rewrite claim 18 to read as follows:

- a<sup>4</sup> 18. The form of claim 1 which is resistant to denting and has a flexural modulus at 110°F between about 20,000 and 60,000 as measured by ASTM D 790-99.

Please rewrite claim 44 to read as follows:

- a<sup>5</sup> 44. A method for making a molded article, selected from the group consisting of urns, frames, furniture, fixtures, display props and garden furniture, of an elastomeric composition, said method comprising:
